BIT DataPlatform SaaS

Product Sheet · Service

Even a small business can have big data.
You don’t need to process millions of transactions a day for data integration to make economic sense. A data platform and BI-as-a-Service consolidate business data into a unified foundation for reporting, analytics, and the meaningful application of artificial intelligence—all without the need to build your own data infrastructure.

What problem the service solves

Fragmented Data
Customers, orders, or products have different identifiers in each system, and the results are pieced together manually.

Different numbers for the same question
Branches and teams calculate revenue or margins according to their own rules.

Supporting materials instead of decisions
Before every meeting, data is exported and recalculated. There is no time left to explain the results.

What you get

No infrastructure of your own
You don’t need to buy servers or build a data team. We operate the platform.

Quick Start
Start with a single area and get your first results without a lengthy technology project.

Dedicated Data Space

Your data is kept separate from that of other customers, and access is configured based on roles.

Trustworthy Numbers

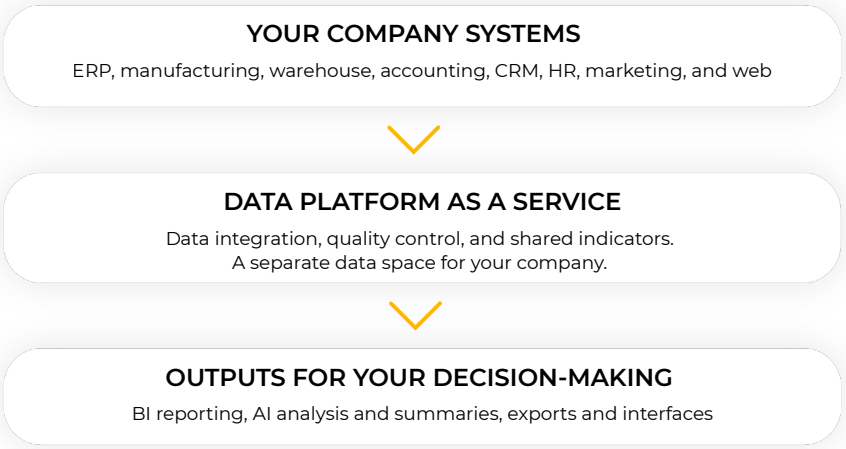

Quality checks, a catalog, and traceable data origins.

AI that analyzes data

Integrated AI works with your data and helps to analyze it quickly.

How the data platform works

The platform addresses the layer between your enterprise systems and their analytical use. Your systems remain exactly where they are. The platform connects their data for analytical purposes without altering orders, invoices, or personnel records.

What areas can the platform connect

The data platform will connect your data across departments.

ERP and Business Management

Orders, deliveries, invoicing, and costs—all in one place. You know exactly what has been ordered, delivered, invoiced, and paid for.

Production

Orders, material consumption, time worked, and quality—all in one place. You know which orders are exceeding their planned costs.

Warehouse and Purchasing

Inventory, reservations, purchasing, and sales—all in one place. You know where your capital is tied up and what is at risk of running out.

Accounting and Controlling

Accounting, budgeting, projects, and cost centers—all in one place. You know the source of any variances and when the money will arrive.

CRM and Sales

Inquiries, quotes, orders, and fulfillment—all in one place. You'll know which deals deliver the desired margin.

HR and Projects

Project planning, capacity, and logged time—all in one place. You can see where multiple demands converge on the same team.

Marketing and Web Analytics

Campaigns, website traffic, conversions, and sales—all in one place. Know which channels bring in actual customers.

E-commerce and Stores

Orders, discounts, returns, and costs—all in one place. Know which products and branches are truly profitable.

Service and Customer Experience

Service requests, on-site visits, parts, and technician time—all combined. You can identify which contracts require more work than anticipated.

Start with the data you already have.

Tell us which systems you use and which questions you currently cannot answer quickly. We will suggest an area to start with and prepare initial outputs—without the need to build your own infrastructure.

If you do not want the platform as a service, we offer BIT DataPlatform for your own infrastructure.
